Elevate Security

Human Risk Management for Energy & Utilities

Since 2017, there have been 45 cyber attacks on the energy industry, with frequency and targeted focus ramping significantly since 2022. According to PwC, cybersecurity is a top priority for CISOs in the energy and utilities sector for the next three years, especially given the ongoing transition from aging technology.

As providers of critical national infrastructure, thwarting adversaries is paramount to securing the defense of the nation state and its citizens. When deploying comprehensive defense-in-depth, it's important to protect today's primary attack target—your people.

Research finds that 8% of employees cause 80% of security incidents. This small segment routinely demonstrate unsecure behaviors that open the door to worst-case cyber scenarios and vulnerable to attack. Elevate helps you find (and protect) these users before your adversaries do.

Identify and safeguard your riskiest people!

Elevate is helping the energy and utilities industry reduce their human risk. A global energy firm has experienced the following improvements:

Elevate drives measurable behavior change and security improvements

⌃ **6.3x**
Increase of **phishing reporting**

⌃ **3.8x**
Increase in **phishing email identification**

⌃ **6.2x**
Increase in **blocked phishing attacks**

- Delivers board-level reporting on hot spots across the company
- Drives accountability across the employee base
- Helps the security team better protect high-risk individuals from targeted attacks
- Aligns human risk data with identity teams to drive smarter access policies

What can Elevate Security do for your organization?

Elevate ingests and analyzes data from across your estate to identify and score individual cyber risk based on behaviors and attack history. Automated risk response enables use of interventions that drive real improvements to your overall security posture—and help turn your people into your greatest defenders!

"Risk is not uniformly distributed among organizations, that much is clear from the results of our research. In fact, some users represent orders of magnitude more risk than others."

—Ben Edwards, Cyentia Institute Partner and Data Scientist
